This software and related documentation are provided under a license agreement containing restrictions on use and disclosure and are protected by intellectual property laws. Except as expressly permitted in your license agreement or allowed by law, you may not use, copy, reproduce, translate, broadcast, modify, license, transmit, distribute, exhibit, perform, publish, or display any part, in any form, or by any means. Reverse engineering, disassembly, or decompilation of this software, unless required by law for interoperability, is prohibited.

The information contained herein is subject to change without notice and is not warranted to be error-free. If you find any errors, please report them to us in writing.

If this is software or related documentation that is delivered to the U.S. Government or anyone licensing it on behalf of the U.S. Government, then the following notice is applicable:

U.S. GOVERNMENT END USERS: Oracle programs (including any operating system, integrated software, any programs embedded, installed or activated on delivered hardware, and modifications of such programs) and Oracle computer documentation or other Oracle data delivered to or accessed by U.S. Government end users are "commercial computer software" or "commercial computer software documentation" pursuant to the applicable Federal Acquisition Regulation and agency-specific supplemental regulations. As such, the use, reproduction, duplication, release, display, disclosure, modification, preparation of derivative works, and/or adaptation of i) Oracle programs (including any operating system, integrated software, any programs embedded, installed or activated on delivered hardware, and modifications of such programs), ii) Oracle computer documentation and/or iii) other Oracle data, is subject to the rights and limitations specified in the license contained in the applicable contract. The terms governing the U.S. Government's use of Oracle cloud services are defined by the applicable contract for such services. No other rights are granted to the U.S. Government.

This software or hardware is developed for general use in a variety of information management applications. It is not developed or intended for use in any inherently dangerous applications, including applications that may create a risk of personal injury. If you use this software or hardware in dangerous applications, then you shall be responsible to take all appropriate fail-safe, backup, redundancy, and other measures to ensure its safe use. Oracle Corporation and its affiliates disclaim any liability for any damages caused by use of this software or hardware in dangerous applications.

Oracle, Java, and MySQL are registered trademarks of Oracle and/or its affiliates. Other names may be trademarks of their respective owners.

Intel and Intel Inside are trademarks or registered trademarks of Intel Corporation. All SPARC trademarks are used under license and are trademarks or registered trademarks of SPARC International, Inc. AMD, Epyc, and the AMD logo are trademarks or registered trademarks of Advanced Micro Devices. UNIX is a registered trademark of The Open Group.

This software or hardware and documentation may provide access to or information about content, products, and services from third parties. Oracle Corporation and its affiliates are not responsible for and expressly disclaim all warranties of any kind with respect to third-party content, products, and services unless otherwise set forth in an applicable agreement between you and Oracle. Oracle Corporation and its affiliates will not be responsible for any loss, costs, or damages incurred due to your access to or use of third-party content, products, or services, except as set forth in an applicable agreement between you and Oracle.

Preface

This reference contains a complete description of the Structured Query Language (SQL) used to manage information in an Oracle Database. Oracle SQL is a superset of the American National Standards Institute (ANSI) and the International Organization for Standardization (ISO) SQL:2011 standard.

This Preface contains these topics:

- Audience
- Documentation Accessibility
- Related Documents
- Conventions

Audience

The Oracle Database SQL Language Quick Reference is intended for all users of Oracle SQL.

Documentation Accessibility

For information about Oracle's commitment to accessibility, visit the Oracle Accessibility Program website at http://www.oracle.com/pls/topic/lookup?ctx=acc&id=docacc.

Access to Oracle Support

Oracle customers that have purchased support have access to electronic support through My Oracle Support. For information, visit http://www.oracle.com/pls/topic/lookup?ctx=acc&id=info or visit http://www.oracle.com/pls/topic/lookup?ctx=acc&id=trs if you are hearing impaired.

Related Documents

For more information, see these Oracle resources:

- Oracle Database PL/SQL Language Reference for information on PL/SQL, the procedural language extension to Oracle SQL
- Pro*C/C++ Programmer's Guide and Pro*COBOL Programmer's Guide for detailed descriptions of Oracle embedded SQL

Many of the examples in this book use the sample schemas, which are installed by default when you select the Basic Installation option with an Oracle Database installation. Refer to *Oracle Database Sample Schemas* for information on how these schemas were created and how you can use them yourself.

Conventions

The following text conventions are used in this document:

•	
Convention	Meaning
boldface	Boldface type indicates graphical user interface elements associated with an action, or terms defined in text or the glossary.
italic	Italic type indicates book titles, emphasis, or placeholder variables for which you supply particular values.
monospace	Monospace type indicates commands within a paragraph, URLs, code in examples, text that appears on the screen, or text that you enter.

SQL Statements

This chapter presents the syntax for Oracle SQL statements.

This chapter includes the following section:

Syntax for SQL Statements

Syntax for SQL Statements

SQL statements are the means by which programs and users access data in an Oracle database.

The sections that follow show each SQL statement and its related syntax. Refer to Subclauses for the syntax of the subclauses listed in the syntax for the statements.

Oracle Database SQL Language Reference for detailed information about SQL statements

ADMINISTER KEY MANAGEMENT

```
ADMINISTER KEY MANAGEMENT
{ keystore_management_clauses
| key_management_clauses
| secret_management_clauses
};
```

ALTER ANALYTIC VIEW

```
ALTER ANALYTIC VIEW [ schema. ] analytic_view_name { RENAME TO new_av_name | COMPILE };
```

ALTER ATTRIBUTE DIMENSION

```
ALTER ATTRIBUTE DIMENSION [ schema. ] attr_dim_name { RENAME TO new_attr_dim_name | COMPILE };
```

ALTER AUDIT POLICY

```
ALTER AUDIT POLICY policy

[ ADD [ privilege_audit_clause ] [ action_audit_clause ] [ role_audit_clause ] ]

[ DROP [ privilege_audit_clause ] [ action_audit_clause ] [ role_audit_clause ] ]

[ CONDITION { DROP | 'audit_condition' EVALUATE PER { STATEMENT | SESSION | INSTANCE } } ]

;
```

ALTER CLUSTER

```
ALTER CLUSTER [ schema. ] cluster { physical_attributes_clause | SIZE size clause
```

```
| [ MODIFY PARTITION partition ] allocate_extent_clause
| deallocate_unused_clause
| { CACHE | NOCACHE }
} ...
[ parallel_clause ] ;
```

ALTER DATABASE

```
ALTER DATABASE [ database ]
{ startup_clauses
| recovery_clauses
| database_file_clauses
| logfile_clauses
| controlfile_clauses
| standby_database_clauses
| default_settings_clauses
| instance_clauses
| security_clause
} ;
```

ALTER DATABASE DICTIONARY DELETE CREDENTIALS KEY

ALTER DATABASE DICTIONARY ENCRYPT CREDENTIALS

ALTER DATABASE DICTIONARY REKEY CREDENTIALS

ALTER DATABASE LINK

```
ALTER [ SHARED ] [ PUBLIC ] DATABASE LINK dblink
  { CONNECT TO user IDENTIFIED BY password [ dblink_authentication ]
  | dblink_authentication
  };
```

ALTER DIMENSION

ALTER DISKGROUP

```
| diskgroup_template_clauses
    | diskgroup_directory_clauses
    | diskgroup alias clauses
    | diskgroup_volume_clauses
    | diskgroup attributes
    | modify diskgroup file
    | drop diskgroup file clause
    convert redundancy_clause
    | usergroup_clauses
    | user clauses
    | file permissions clause
    | file owner clause
    | scrub clause
    | quotagroup clauses
    | filegroup clauses
  | { diskgroup name [, diskgroup name ]...
    | ALL
    } { undrop disk clause
      | diskgroup_availability
      | enable disable volume
} ;
```

ALTER FLASHBACK ARCHIVE

ALTER FUNCTION

```
ALTER FUNCTION [ schema. ] function_name { function compile clause | { EDITIONABLE | NONEDITIONABLE } }
```

ALTER HIERARCHY

```
ALTER HIERARCHY [ schema. ] hierarchy_name { RENAME TO new hier name | COMPILE };
```

ALTER INDEX

```
ALTER INDEX [ schema. ]index
  { { deallocate unused clause
    | allocate extent clause
    | shrink clause
    | parallel_clause
    | physical_attributes_clause
    | logging_clause
    | partial index clause
  | rebuild clause [ { DEFERRED | IMMEDIATE } INVALIDATION ]
  | PARAMETERS ( 'ODCI parameters' )
  | COMPILE
  | { ENABLE | DISABLE }
  | UNUSABLE [ ONLINE ] [ { DEFERRED | IMMEDIATE } INVALIDATION ]
  | VISIBLE | INVISIBLE
  | RENAME TO new name
  | COALESCE [ CLEANUP ] [ parallel clause ]
  | { MONITORING | NOMONITORING } USAGE
  | UPDATE BLOCK REFERENCES
  | alter index partitioning
```

}

ALTER INDEXTYPE

ALTER INMEMORY JOIN GROUP

```
ALTER INMEMORY JOIN GROUP [ schema. ] join_group { ADD | REMOVE } ( [ schema. ] table ( column ) );
```

ALTER JAVA

ALTER LIBRARY

```
ALTER LIBRARY [ schema. ] library_name { library compile clause | { EDITIONABLE | NONEDITIONABLE } }
```

ALTER LOCKDOWN PROFILE

ALTER MATERIALIZED VIEW

```
ALTER MATERIALIZED VIEW
  [ schema. ] materialized view
  [ physical_attributes clause
  | modify_mv_column_clause
  | table compression
  | inmemory_table_clause
  | LOB storage clause [, LOB storage clause ]...
  | modify_LOB_storage_clause [, modify_LOB_storage_clause ]...
  | alter_table_partitioning
  | parallel clause
  | logging_clause
  | allocate extent clause
  | deallocate unused clause
  | shrink clause
  | { CACHE | NOCACHE }
  [ alter iot clauses ]
  [ USING INDEX physical attributes clause ]
  [ MODIFY scoped_table_ref_constraint
  | alter_mv_refresh
  [ evaluation_edition_clause ]
  [ { ENABLE | DISABLE } ON QUERY COMPUTATION ]
```

```
[ alter_query_rewrite_clause
| COMPILE
| CONSIDER FRESH
];
```

ALTER MATERIALIZED VIEW LOG

```
ALTER MATERIALIZED VIEW LOG [ FORCE ]

ON [ schema. ]table
[ physical_attributes_clause
| add_mv_log_column_clause
| alter_table_partitioning
| parallel_clause
| logging_clause
| allocate_extent_clause
| shrink_clause
| move_mv_log_clause
| { CACHE | NOCACHE }
] [ mv_log_augmentation ] [ mv_log_purge_clause ] [ for_refresh_clause ];
```

ALTER MATERIALIZED ZONEMAP

```
ALTER MATERIALIZED ZONEMAP [ schema. ] zonemap_name { alter_zonemap_attributes | zonemap_refresh_clause | { ENABLE | DISABLE } PRUNING | COMPILE | REBUILD | UNUSABLE } ;
```

ALTER OPERATOR

ALTER OUTLINE

```
ALTER OUTLINE [ PUBLIC | PRIVATE ] outline { REBUILD | RENAME TO new_outline_name | CHANGE CATEGORY TO new_category_name | { ENABLE | DISABLE } } ... :
```

ALTER PACKAGE

```
ALTER PACKAGE [ schema. ] package_name { package compile clause | { EDITIONABLE | NONEDITIONABLE } }
```

ALTER PLUGGABLE DATABASE

```
ALTER PLUGGABLE DATABASE

SQL Functions

This chapter presents the syntax for SQL functions.

This chapter includes the following section:

Syntax for SQL Functions

Syntax for SQL Functions

A function is a command that manipulates data items and returns a single value.

The sections that follow show each SQL function and its related syntax. Refer to Subclauses for the syntax of the subclauses.

See Also:

Oracle Database SQL Language Reference for detailed information about SQL functions

ABS

ABS(n)

ACOS

ACOS(n)

ADD_MONTHS

ADD MONTHS (date, integer)

aggregate_function

Aggregate functions return a single result row based on groups of rows, rather than on single rows.

analytic_function

```
analytic_function([ arguments ]) OVER (analytic_clause)
```

APPENDCHILDXML

```
APPENDCHILDXML (XMLType instance, XPath string, value expr [, namespace string ])
```

APPROX_COUNT_DISTINCT

APPROX COUNT DISTINCT(expr)

APPROX_COUNT_DISTINCT_AGG

APPROX_COUNT_DISTINCT_AGG(detail)

APPROX_COUNT_DISTINCT_DETAIL

APPROX_COUNT_DISTINCT_DETAIL(expr)

APPROX_MEDIAN

```
APPROX MEDIAN( expr [ DETERMINISTIC ] [, { 'ERROR RATE' | 'CONFIDENCE' } ] )
```

APPROX_PERCENTILE

```
APPROX_PERCENTILE( expr [ DETERMINISTIC ] [, { 'ERROR_RATE' | 'CONFIDENCE' } ] ) WITHIN GROUP ( ORDER BY expr [ DESC | ASC ] )
```

APPROX_PERCENTILE_AGG

APPROX PERCENTILE AGG(expr)

APPROX_PERCENTILE_DETAIL

```
APPROX_PERCENTILE_DETAIL( expr [ DETERMINISTIC ] )
```

ASCII

ASCII(char)

ASCIISTR

ASCIISTR(char)

ASIN

ASIN(n)

ATAN

ATAN(n)

ATAN2

ATAN2(n1 , n2)

AVG

AVG([DISTINCT | ALL] expr) [OVER(analytic_clause)]

BFILENAME

BFILENAME('directory', 'filename')

BIN_TO_NUM

BIN_TO_NUM(expr [, expr]...)

BITAND

BITAND(expr1, expr2)

CARDINALITY

```
CARDINALITY (nested table)
```

CAST

```
CAST({ expr | MULTISET (subquery) } AS type_name

SQL Expressions

This chapter presents the syntax for combining values, operators, and functions into expressions.

This chapter includes the following section:

Syntax for SQL Expression Types

Syntax for SQL Expression Types

An expression is a combination of one or more values, operators, and SQL functions that evaluate to a value. An expression generally assumes the data type of its components.

Expressions have several forms. The sections that follow show the syntax for each form of expression. Refer to Subclauses for the syntax of the subclauses.

Oracle Database SQL Language Reference for detailed information about SQL expressions

Calculated Measure Expressions

```
{    av_meas_expression
    | av_simple_expression
    | single_row_function_expression
    | case_expression
    | compound_expression
    | datetime_expression
    | interval_expression
}
```

CASE expressions

Column expressions

A column expression can be a simple expression, compound expression, function expression, or expression list, containing only columns of the subject table, constants, and deterministic functions.

Compound expressions

```
{ (expr) | { + | - | PRIOR } expr | expr { * | / | + | - | || } expr
```

CURSOR expressions

CURSOR (subquery)

Datetime expressions

Function expressions

You can use any built-in SQL function or user-defined function as an expression.

Interval expressions

```
( expr1 - expr2 )
   { DAY [ (leading_field_precision) ] TO
    SECOND [ (fractional_second_precision) ]
   | YEAR [ (leading_field_precision) ] TO
    MONTH
   }
```

JSON object access expressions

```
table_alias.JSON_column [.JSON_object_key [ array_step ]... ]...
```

Model expressions

```
{ measure_column [ { condition | expr } [, { condition | expr } ]... ]
| aggregate_function
| { [ { condition | expr } [, { condition | expr } ]... ]
| [ single_column_for_loop [, single_column_for_loop ]... ]
| [ multi_column_for_loop ]
| }
| analytic_function
}
Note: The outside square brackets shown in boldface type are part of the syntax. In this case, they do not represent optionality.
```

Object access expressions

```
{ table_alias.column.
| object_table_alias.
| (expr).
}
{ attribute [.attribute ]...
  [.method ([ argument [, argument ]... ]) ]
| method ([ argument [, argument ]... ]) }
```

Placeholder expressions

```
:host_variable
   [ [ INDICATOR ]
     :indicator_variable
]
```

Scalar subquery expressions

A scalar subquery expression is a subquery that returns exactly one column value from one row.

Simple expressions

Type constructor expressions

```
[ NEW ] [ schema. ]type_name
  ([ expr [, expr ]... ])
```

SQL Conditions

This chapter presents the syntax for combining one or more expressions and logical (Boolean) operators to specify a condition.

This chapter includes the following section:

Syntax for SQL Condition Types

Syntax for SQL Condition Types

A condition specifies a combination of one or more expressions and logical (Boolean) operators and returns a value of TRUE, FALSE, or unknown.

Conditions have several forms. The sections that follow show the syntax for each form of condition. Refer to Subclauses for the syntax of the subclauses.

Oracle Database SQL Language Reference for detailed information about SQL conditions

BETWEEN condition

```
expr1 [ NOT ] BETWEEN expr2 AND expr3
```

Compound conditions

```
{ (condition)
| NOT condition
| condition { AND | OR } condition
}
```

EQUALS_PATH condition

EXISTS condition

```
EXISTS (subquery)
```

Floating-point conditions

```
expr IS [ NOT ] { NAN | INFINITE }
```

Group comparison conditions

```
{ expr
	{ = | != | ^= | <> | > | < | >= | <= }
	{ ANY | SOME | ALL }
	({ expression_list | subquery })
```

```
| ( expr [, expr ]... )
{ = | != | ^= | <> }
{ ANY | SOME | ALL }
({ expression_list
      [, expression_list ]...
      | subquery
    }
)
```

where !=, ^=, and <> test for inequality

IN condition

IS A SET condition

```
nested table IS [ NOT ] A SET
```

IS ANY condition

```
[ dimension column IS ] ANY
```

IS EMPTY condition

```
nested table IS [ NOT ] EMPTY
```

IS JSON condition

```
expr IS [ NOT ] JSON [ FORMAT JSON ] [ STRICT | LAX ]
[ { WITH | WITHOUT } UNIQUE KEYS ]
```

IS OF type condition

```
expr IS [ NOT ] OF [ TYPE ]
    ([ ONLY ] [ schema. ] type
        [, [ ONLY ] [ schema. ] type ]...
)
```

IS PRESENT condition

```
cell reference IS PRESENT
```

JSON_EXISTS condition

```
JSON_EXISTS( expr [ FORMAT JSON ], JSON_basic_path_expression
[ JSON_passing_clause ] [ JSON_exists_on_error_clause ] )
```

JSON_TEXTCONTAINS condition

```
JSON TEXTCONTAINS (column, JSON basic path expression, string)
```

LIKE condition

```
char1 [ NOT ] { LIKE | LIKEC | LIKE2 | LIKE4 }
  char2 [ ESCAPE esc char ]
```

Logical conditions

```
{ NOT | AND | OR }
```

MEMBER condition

```
expr [ NOT ] MEMBER [ OF ] nested_table
```

Null conditions

```
expr IS [ NOT ] NULL
```

REGEXP_LIKE condition

Simple comparison conditions

```
{ expr
  { = | != | ^= | <> | > | < | >= | <= }
  expr
| (expr [, expr ]...)
  { = | != | ^= | <> }
  ( expression_list | subquery )
}
```

where !=, ^=, and <> test for inequality

SUBMULTISET condition

```
nested_table1
[ NOT ] SUBMULTISET [ OF ]
nested_table2
```

UNDER_PATH condition

Subclauses

This chapter presents the syntax for the subclauses found in the syntax for SQL statements, functions, expressions and conditions.

This chapter includes the following section:

· Syntax for Subclauses

Syntax for Subclauses

The sections that follow show the syntax for each subclause found in:

- SQL Statements
- SQL Functions
- SQL Expressions
- SQL Conditions

Oracle Database SQL Language Reference for detailed information about SQL subclauses

Data Types

This chapter presents data types that are recognized by Oracle and available for use within SQL.

This chapter includes the following sections:

- Overview of Data Types
- Oracle Built-In Data Types
- Oracle-Supplied Data Types
- Converting to Oracle Data Types

Overview of Data Types

A **data type** is a classification of a particular type of information or data. Each value manipulated by Oracle has a data type. The data type of a value associates a fixed set of properties with the value. These properties cause Oracle to treat values of one data type differently from values of another.

The data types recognized by Oracle are:

ANSI-supported data types

```
{ CHARACTER [VARYING] (size)
| { CHAR | NCHAR } VARYING (size)
| VARCHAR (size)
| NATIONAL { CHARACTER | CHAR }
        [VARYING] (size)
| { NUMERIC | DECIMAL | DEC }
        [ (precision [, scale ]) ]
| { INTEGER | INT | SMALLINT }
| FLOAT [ (size) ]
| DOUBLE PRECISION
| REAL
}
```

Oracle built-in data types

```
{ character_datatypes
| number_datatypes
| long_and_raw_datatypes
| datetime_datatypes
| large_object_datatypes
| rowid_datatypes
}
```

Oracle-supplied data types

```
{ any_types | XML_types | spatial_types | media_types }
```

User-defined data types

User-defined data types use Oracle built-in data types and other user-defined data types to model the structure and behavior of data in applications.

Oracle Database SQL Language Reference for more information about data types

Oracle Built-In Data Types

This section describes the kinds of Oracle built-in data types.

character_datatypes

```
{ CHAR [ (size [ BYTE | CHAR ]) ] | VARCHAR2 (size [ BYTE | CHAR ]) | NCHAR [ (size) ] | NVARCHAR2 (size) }
```

datetime_datatypes

large_object_datatypes

```
{ BLOB | CLOB | NCLOB | BFILE }
```

long_and_raw_datatypes

```
{ LONG | LONG RAW | RAW (size) }
```

number_datatypes

```
{ NUMBER [ (precision [, scale ]) ] | FLOAT [ (precision) ] | BINARY_FLOAT | BINARY_DOUBLE
```

rowid_datatypes

```
{ ROWID | UROWID [ (size) ] }
```

The codes listed for the data types are used internally by Oracle Database. The data type code of a column or object attribute is returned by the DUMP function.

Table 6-1 Built-in Data Type Summary

Code	Data Type	Description
1	VARCHAR2(size [BYTE CHAR])	Variable-length character string having maximum length $size$ bytes or characters. You must specify $size$ for VARCHAR2. Minimum $size$ is 1 byte or 1 character. Maximum size is:
		 32767 bytes or characters if MAX_STRING_SIZE = EXTENDED
		 4000 bytes or characters if MAX_STRING_SIZE = STANDARD
		Refer to <i>Oracle Database SQL Language Reference</i> for more information on the MAX_STRING_SIZE initialization parameter.
		BYTE indicates that the column will have byte length semantics. CHAR indicates that the column will have character semantics.
1	NVARCHAR2(size)	Variable-length Unicode character string having maximum length size characters. You must specify size for NVARCHAR2. The number of bytes can be up to two times size for AL16UTF16 encoding and three times size for UTF8 encoding. Maximum size is determined by the national character set definition, with an upper limit of: 32767 bytes if MAX_STRING_SIZE = EXTENDED 4000 bytes if MAX_STRING_SIZE = STANDARD Refer to Oracle Database SQL Language Reference for more information on the MAX_STRING_SIZE initialization parameter.
2	NUMBER [(ρ[, s])]	Number having precision p and scale s . The precision p can range from 1 to 38. The scale s can range from -84 to 127. Both precision and scale are in decimal digits. A <code>NUMBER</code> value requires from 1 to 22 bytes.
2	FLOAT [(p)]	A subtype of the NUMBER data type having precision p . A FLOAT value is represented internally as NUMBER. The precision p can range from 1 to 126 binary digits. A FLOAT value requires from 1 to 22 bytes.
8	LONG	Character data of variable length up to 2 gigabytes, or 2 ³¹ -1 bytes. Provided for backward compatibility.
12	DATE	Valid date range from January 1, 4712 BC, to December 31, 9999 AD. The default format is determined explicitly by the NLS_DATE_FORMAT parameter or implicitly by the NLS_TERRITORY parameter. The size is fixed at 7 bytes. This data type contains the datetime fields YEAR, MONTH, DAY, HOUR, MINUTE, and SECOND. It does not have fractional seconds or a time zone.
100	BINARY_FLOAT	32-bit floating point number. This data type requires 4 bytes.
101	BINARY_DOUBLE	64-bit floating point number. This data type requires 8 bytes.

Table 6-1 (Cont.) Built-in Data Type Summary

Code	Data Type	Description
180	TIMESTAMP [(fractional_seconds_precision)]	Year, month, and day values of date, as well as hour, minute, and second values of time, where <code>fractional_seconds_precision</code> is the number of digits in the fractional part of the <code>SECOND</code> datetime field. Accepted values of <code>fractional_seconds_precision</code> are 0 to 9. The default is 6. The default format is determined explicitly by the <code>NLS_TIMESTAMP_FORMAT</code> parameter or implicitly by the <code>NLS_TERRITORY</code> parameter. The size is 7 or 11 bytes, depending on the precision. This data type contains the datetime fields <code>YEAR</code> , <code>MONTH</code> , <code>DAY</code> , <code>HOUR</code> , <code>MINUTE</code> , and <code>SECOND</code> . It contains fractional seconds but does not have a time zone.
181	TIMESTAMP [(fractional_seconds_precision)] WITH TIME ZONE	All values of TIMESTAMP as well as time zone displacement value, where <code>fractional_seconds_precision</code> is the number of digits in the fractional part of the <code>SECOND</code> datetime field. Accepted values are 0 to 9. The default is 6. The default format is determined explicitly by the <code>NLS_TIMESTAMP_FORMAT</code> parameter or implicitly by the <code>NLS_TERRITORY</code> parameter. The size is fixed at 13 bytes. This data type contains the datetime fields <code>YEAR</code> , <code>MONTH</code> , <code>DAY</code> , <code>HOUR</code> , <code>MINUTE</code> , <code>SECOND</code> , <code>TIMEZONE_HOUR</code> , and <code>TIMEZONE_MINUTE</code> . It has fractional seconds and an explicit time zone.
231	TIMESTAMP [(fractional_seconds_precision)] WITH LOCAL TIME ZONE	 All values of TIMESTAMP WITH TIME ZONE, with the following exceptions: Data is normalized to the database time zone when it is stored in the database. When the data is retrieved, users see the data in the session time zone. The default format is determined explicitly by the NLS_TIMESTAMP_FORMAT parameter or implicitly by the NLS_TERRITORY parameter. The size is 7 or 11 bytes, depending on the precision.
182	INTERVAL YEAR [(year_precision)] TO MONTH	Stores a period of time in years and months, where year_precision is the number of digits in the YEAR datetime field. Accepted values are 0 to 9. The default is 2. The size is fixed at 5 bytes.
183	INTERVAL DAY [(day_precision)] TO SECOND [(fractional_seconds_precision)]	Stores a period of time in days, hours, minutes, and seconds, where • day_precision is the maximum number of digits in the DAY datetime field. Accepted values are 0 to 9. The default is 2. • fractional_seconds_precision is the number of digits in the fractional part of the SECOND field. Accepted values are 0 to 9. The default is 6. The size is fixed at 11 bytes.
23	RAW(size)	Raw binary data of length size bytes. You must specify size for a RAW value. Maximum size is: • 32767 bytes if MAX_STRING_SIZE = EXTENDED • 2000 bytes if MAX_STRING_SIZE = STANDARD Refer to Oracle Database SQL Language Reference for more information on the MAX_STRING_SIZE initialization parameter.

Table 6-1 (Cont.) Built-in Data Type Summary

Code	Data Type	Description
24	LONG RAW	Raw binary data of variable length up to 2 gigabytes.
69	ROWID	Base 64 string representing the unique address of a row in its table. This data type is primarily for values returned by the ROWID pseudocolumn.
208	UROWID [(size)]	Base 64 string representing the logical address of a row of an index-organized table. The optional size is the size of a column of type UROWID. The maximum size and default is 4000 bytes.
96	CHAR [(size [BYTE CHAR])]	Fixed-length character data of length $size$ bytes or characters. Maximum $size$ is 2000 bytes or characters. Default and minimum $size$ is 1 byte.
		BYTE and CHAR have the same semantics as for VARCHAR2.
96	NCHAR [(size)]	Fixed-length character data of length $size$ characters. The number of bytes can be up to two times $size$ for AL16UTF16 encoding and three times $size$ for UTF8 encoding. Maximum $size$ is determined by the national character set definition, with an upper limit of 2000 bytes. Default and minimum $size$ is 1 character.
112	CLOB	A character large object containing single-byte or multibyte characters. Both fixed-width and variable-width character sets are supported, both using the database character set. Maximum size is (4 gigabytes - 1) * (database block size).
112	NCLOB	A character large object containing Unicode characters. Both fixed-width and variable-width character sets are supported, both using the database national character set. Maximum size is (4 gigabytes - 1) * (database block size). Stores national character set data.
113	BLOB	A binary large object. Maximum size is (4 gigabytes - 1) * (database block size).
114	BFILE	Contains a locator to a large binary file stored outside the database. Enables byte stream I/O access to external LOBs residing on the database server. Maximum size is 4 gigabytes.

See Also:

Oracle Database SQL Language Reference for more information about built-in data types

Oracle-Supplied Data Types

This section shows the syntax for the Oracle-supplied data types.

any_types

{ SYS.AnyData | SYS.AnyType | SYS.AnyDataSet }

media_types

```
{ ORDAudio | ORDImage | ORDVideo | ORDVideo | ORDDoc | ORDDicom | still_image_object_types } 

spatial_types | SDO_Topo_Geometry | SDO_GeoRaster | SML_types | XML_types | URIType | URIType | ORDITION | STATE | STAT
```

Converting to Oracle Data Types

SQL statements that create tables and clusters can also use ANSI data types and data types from the IBM products SQL/DS and DB2. Oracle recognizes the ANSI or IBM data type name that differs from the Oracle data type name, records it as the name of the data type of the column, and then stores the column data in an Oracle data type based on the conversions shown in the following table.

Table 6-2 ANSI Data Types Converted to Oracle Data Types

ANSI SQL Data Type	Oracle Data Type
CHARACTER(n)	CHAR(n)
CHAR(n)	
CHARACTER VARYING(n)	VARCHAR2(n)
CHAR VARYING(n)	
NATIONAL CHARACTER(n)	NCHAR(n)
NATIONAL CHAR(n)	
NCHAR(n)	
NATIONAL CHARACTER VARYING(n)	NVARCHAR2(n)
NATIONAL CHAR VARYING(n)	
NCHAR VARYING(n)	
NUMERIC[(p,s)]	NUMBER(p,s)
DECIMAL[(p,s)] (Note 1)	
INTEGER	NUMBER(p,0)
INT	
SMALLINT	
FLOAT (Note 2)	FLOAT (126)
DOUBLE PRECISION (Note 3)	FLOAT (126)
REAL (Note 4)	FLOAT(63)

Notes:

- 1. The NUMERIC and DECIMAL data types can specify only fixed-point numbers. For those data types, the scale (s) defaults to 0.
- 2. The FLOAT data type is a floating-point number with a binary precision b. The default precision for this data type is 126 binary, or 38 decimal.
- 3. The DOUBLE PRECISION data type is a floating-point number with binary precision 126.
- 4. The REAL data type is a floating-point number with a binary precision of 63, or 18 decimal.

Do not define columns with the following SQL/DS and DB2 data types, because they have no corresponding Oracle data type:

- GRAPHIC
- LONG VARGRAPHIC
- VARGRAPHIC
- TIME

Note that data of type \mbox{TIME} can also be expressed as Oracle datetime data.

Oracle Database SQL Language Reference for more information on data types

7

Format Models

This chapter presents the format models for datetime and number data stored in character strings.

This chapter includes the following sections:

- Overview of Format Models
- Number Format Models
- Datetime Format Models

Overview of Format Models

A format model is a character literal that describes the format of DATETIME or NUMBER data stored in a character string. When you convert a character string into a datetime or number, a format model tells Oracle how to interpret the string.

Oracle Database SQL Language Reference for more information on format models

Number Format Models

You can use number format models:

- In the TO CHAR function to translate a value of NUMBER data type to VARCHAR2 data type
- In the TO_NUMBER function to translate a value of CHAR or VARCHAR2 data type to NUMBER data type

Number Format Elements

A number format model is composed of one or more number format elements. The following table lists the elements of a number format model.

Table 7-1 Number Format Elements

Element	Example	Description	
, (comma)	9,999	Returns a comma in the specified position. You can specify multiple commas in a number format model.	
		Restrictions:	
		 A comma element cannot begin a number format model. 	
		 A comma cannot appear to the right of a decimal character or period in a number format model. 	

Table 7-1 (Cont.) Number Format Elements

Element	Example	Description
. (period)	99.99	Returns a decimal point, which is a period (.) in the specified position.
		Restriction: You can specify only one period in a number format model.
\$	\$9999	Returns value with a leading dollar sign.
0	0999	Returns leading zeros.
	9990	Returns trailing zeros.
9	9999	Returns value with the specified number of digits with a leading space if positive or with a leading minus if negative. Leading zeros are blank, except for a zero value, which returns a zero for the integer part of the fixed-point number.
В	В9999	Returns blanks for the integer part of a fixed-point number when the integer part is zero (regardless of zeros in the format model).
С	C999	Returns in the specified position the ISO currency symbol (the current value of the NLS_ISO_CURRENCY parameter).
D	99D99	Returns in the specified position the decimal character, which is the current value of the NLS_NUMERIC_CHARACTER parameter. The default is a period (.).
		Restriction: You can specify only one decimal character in a number format model.
EEEE	9.9EEEE	Returns a value using in scientific notation.
G	9G999	Returns in the specified position the group separator (the current value of the NLS_NUMERIC_CHARACTER parameter). You can specify multiple group separators in a number format model.
		Restriction: A group separator cannot appear to the right of a decimal character or period in a number format model.
L	L999	Returns in the specified position the local currency symbol (the current value of the <code>NLS_CURRENCY</code> parameter).
MI	9999MI	Returns negative value with a trailing minus sign (-).
		Returns positive value with a trailing blank.
		Restriction: The MI format element can appear only in the last position of a number format model.
PR	9999PR	Returns negative value in <angle brackets="">.</angle>
		Returns positive value with a leading and trailing blank.
		Restriction: The PR format element can appear only in the last position of a number format model.
RN	RN	Returns a value as Roman numerals in uppercase.
rn	rn	Returns a value as Roman numerals in lowercase.
		Value can be an integer between 1 and 3999.
S	S9999	Returns negative value with a leading minus sign (-).
	9999S	Returns positive value with a leading plus sign (+).
		Returns negative value with a trailing minus sign (-).
		Returns positive value with a trailing plus sign (+).
		Restriction: The S format element can appear only in the first or last position of a number format model.

Table 7-1 (Cont.) Number Format Elements

Element	Example	Description	
TM	TM	The text minimum number format model returns (in decimal output) the smallest number of characters possible. This element is case insensitive.	
		The default is TM9, which returns the number in fixed notation unless the output exceeds 64 characters. If the output exceeds 64 characters, then Oracle Database automatically returns the number in scientific notation.	
		Restrictions:	
		 You cannot precede this element with any other element. 	
		 You can follow this element only with one 9 or one E (or e), but not with any combination of these. The following statement returns an error: 	
		SELECT TO_CHAR(1234, 'TM9e') FROM DUAL;	
U	U9999	Returns in the specified position the Euro (or other) dual currency symbol, determined by the current value of the NLS_DUAL_CURRENCY parameter.	
V	999V99	Returns a value multiplied by 10^n (and if necessary, round it up), where n is the number of 9's after the V .	
Χ	XXXX	Returns the hexadecimal value of the specified number of digits. If the specified	
	XXXX	number is not an integer, then Oracle Database rounds it to an integer.	
		Restrictions:	
		 This element accepts only positive values or 0. Negative values return an error. 	
		 You can precede this element only with 0 (which returns leading zeroes) or FM. Any other elements return an error. If you specify neither 0 nor FM with X, then the return always has one leading blank. Refer to <i>Oracle Database SQL Language Reference</i> for information on the FM format model modifier. 	

Oracle Database SQL Language Reference for more information on number format models

Datetime Format Models

You can use datetime format models:

- In the TO_CHAR, TO_DATE, TO_TIMESTAMP, TO_TIMESTAMP_TZ, TO_YMINTERVAL, and TO_DSINTERVAL datetime functions to translate a character string that is in a format other than the default datetime format into a DATETIME value
- In the TO_CHAR function to translate a DATETIME value that is in a format other than the default datetime format into a character string

Datetime Format Elements

A datetime format model is composed of one or more datetime format elements. The following table lists the elements of a date format model.

Table 7-2 Datetime Format Elements

Element	TO_* datetime functions?	Description
- / / /	Yes	Punctuation and quoted text is reproduced in the result.
AD A.D.	Yes	AD indicator with or without periods.
AM A.M.	Yes	Meridian indicator with or without periods.
BC B.C.	Yes	BC indicator with or without periods.
CC SCC	No	 Century. If the last 2 digits of a 4-digit year are between 01 and 99 (inclusive), then the century is one greater than the first 2 digits of that year. If the last 2 digits of a 4-digit year are 00, then the century is the same as the first 2 digits of that year. For example, 2002 returns 21; 2000 returns 20.
D	Yes	Day of week (1-7). This element depends on the NLS territory of the session.
DAY	Yes	Name of day.
DD	Yes	Day of month (1-31).
DDD	Yes	Day of year (1-366).
DL	Yes	Returns a value in the long date format, which is an extension of Oracle Database's DATE format, determined by the current value of the NLS_DATE_FORMAT parameter. Makes the appearance of the date components (day name, month number, and so forth) depend on the NLS_TERRITORY and NLS_LANGUAGE parameters. For example, in the AMERICAN_AMERICA locale, this is equivalent to specifying the format 'fmDay, Month dd, yyyy'. In the GERMAN_GERMANY locale, it is equivalent to specifying the format 'fmDay, dd. Month yyyy'. Restriction: You can specify this format only with the TS element, separated by white space.

Table 7-2 (Cont.) Datetime Format Elements

Element	TO_* datetime functions?	Description
DS	Yes	Returns a value in the short date format. Makes the appearance of the date components (day name, month number, and so forth) depend on the NLS_TERRITORY and NLS_LANGUAGE parameters. For example, in the AMERICAN_AMERICA locale, this is equivalent to specifying the format 'MM/DD/RRRR'. In the ENGLISH_UNITED_KINGDOM locale, it is equivalent to specifying the format 'DD/MM/RRRR'.
		Restriction: You can specify this format only with the $\ensuremath{\mathbb{T}} \ensuremath{\mathbb{S}}$ element, separated by white space.
DY	Yes	Abbreviated name of day.
Е	Yes	Abbreviated era name (Japanese Imperial, ROC Official, and Thai Buddha calendars).
EE	Yes	Full era name (Japanese Imperial, ROC Official, and Thai Buddha calendars).
FF [19]	Yes	Fractional seconds; no radix character is printed. Use the X format element to add the radix character. Use the numbers 1 to 9 after FF to specify the number of digits in the fractional second portion of the datetime value returned. If you do not specify a digit, then Oracle Database uses the precision specified for the datetime data type or the data type's default precision. Valid in timestamp and interval formats, but not in DATE formats.
		Examples: 'HH:MI:SS.FF'
		<pre>SELECT TO_CHAR(SYSTIMESTAMP, 'SS.FF3') from dual;</pre>
FM	Yes	Returns a value with no leading or trailing blanks.
rn		See Also : Oracle Database SQL Language Reference for more information on the FM format model modifier
FX	Yes	Requires exact matching between the character data and the format model.
r A		See Also : Oracle Database SQL Language Reference for more information on the FX format model modifier
НН НН12	Yes	Hour of day (1-12).
нн24	Yes	Hour of day (0-23).
IW	No	Week of year (1-52 or 1-53) based on the ISO standard.
IYY IY I	No	Last 3, 2, or 1 digit(s) of ISO year.
IYYY	No	4-digit year based on the ISO standard.
J	Yes	Julian day; the number of days since January 1, 4712 BC. Number specified with J must be integers.

Table 7-2 (Cont.) Datetime Format Elements

Element	TO_* datetime functions?	Description
MI	Yes	Minute (0-59).
MM	Yes	Month (01-12; January = 01).
MON	Yes	Abbreviated name of month.
MONTH	Yes	Name of month.
PM P.M.	Yes	Meridian indicator with or without periods.
Q	No	Quarter of year (1, 2, 3, 4; January - March = 1).
RM	Yes	Roman numeral month (I-XII; January = I).
RR	Yes	Lets you store 20th century dates in the 21st century using only two digits. See Also: Oracle Database SQL Language Reference for more information on the RR datetime format element
RRRR	Yes	Round year. Accepts either 4-digit or 2-digit input. If 2-digit, provides the same return as RR. If you do not want this functionality, then enter the 4-digit year.
SS	Yes	Second (0-59).
SSSSS	Yes	Seconds past midnight (0-86399).
TS	Yes	Returns a value in the short time format. Makes the appearance of the time components (hour, minutes, and so forth) depend on the NLS_TERRITORY and NLS_LANGUAGE initialization parameters.
		Restriction: You can specify this format only with the DL or DS element, separated by white space.
TZD	Yes	Daylight saving information. The TZD value is an abbreviated time zone string with daylight saving information. It must correspond with the region specified in TZR. Valid in timestamp and interval formats, but not in DATE formats.
		$\textbf{Example:} \ \texttt{PST} \ (\text{for US/Pacific standard time}); \ \texttt{PDT} \ (\text{for US/Pacific daylight time}).$
TZH	Yes	Time zone hour. (See ${\tt TZM}$ format element.) Valid in timestamp and interval formats, but not in DATE formats.
		Example: 'HH:MI:SS.FFTZH:TZM'.
TZM	Yes	Time zone minute. (See TZH format element.) Valid in timestamp and interval formats, but not in DATE formats.
		Example: 'HH:MI:SS.FFTZH:TZM'.

Table 7-2 (Cont.) Datetime Format Elements

Element	TO_* datetime functions?	Description
TZR	Yes	Time zone region information. The value must be one of the time zone regions supported in the database. Valid in timestamp and interval formats, but not in DATE formats.
		Example: US/Pacific
WW	No	Week of year (1-53) where week 1 starts on the first day of the year and continues to the seventh day of the year.
W	No	Week of month (1-5) where week 1 starts on the first day of the month and ends on the seventh.
X	Yes	Local radix character.
		Example: 'HH:MI:SSXFF'.
Υ,ΥΥΥ	Yes	Year with comma in this position.
YEAR SYEAR	No	Year, spelled out; S prefixes BC dates with a minus sign (-).
YYYY SYYYY	Yes	4-digit year; S prefixes BC dates with a minus sign.
YYY YY Y	Yes	Last 3, 2, or 1 digit(s) of year.

A

SQL*Plus Commands

This appendix presents many of the SQL*Plus commands.

This appendix includes the following section:

SQL*Plus Commands

SQL*Plus Commands

SQL*Plus is a command-line tool that provides access to the Oracle RDBMS. SQL*Plus enables you to:

- Enter SQL*Plus commands to configure the SQL*Plus environment
- Startup and shutdown an Oracle database
- · Connect to an Oracle database
- Enter and execute SQL commands and PL/SQL blocks
- Format and print query results

SQL*Plus is available on several platforms.

The commands shown in Table A-1 are SQL*Plus commands available in the command-line interface. Not all commands or command parameters are shown.

- SQL*Plus Quick Reference
- SQL*Plus User's Guide and Reference

Table A-1 Basic SQL*Plus Commands

Database Operation	SQL*Plus Command
Log in to SQL*Plus	SQLPLUS [[{username[/password][@connect_identifier] / } [AS {SYSASM SYSBACKUP SYSDBA SYSDG SYSOPER SYSKM}] [edition=value]] /NOLOG]
List help topics available in SQL*Plus	HELP [INDEX topic]

Table A-1 (Cont.) Basic SQL*Plus Commands

Database Operation	SQL*Plus Command
Execute host commands	HOST [command]
Show SQL*Plus system variables or environment settings	SHOW { ALL ERRORS USER system_variable [, system_variable]}
Alter SQL*Plus system variables or environment settings	SET system_variable value
Start up a database	STARTUP { db_options cdb_options upgrade_options }
	Where db_options has the following syntax:
	<pre>[FORCE] [RESTRICT] [PFILE=filename] [QUIET] [MOUNT [dbname] [OPEN [open_db_options] [dbname]] NOMOUNT]</pre>
	Where open_db_options has the following syntax:
	READ {ONLY WRITE [RECOVER]} RECOVER
	Where cdb_options has the following syntax:
	root_connection_options pdb_connection_options
	Where root_connection_options has the following syntax:
	PLUGGABLE DATABASE pdbname [FORCE] [RESTRICT] [OPEN {open_pdb_options}]
	Where pdb_connection_options has the following syntax:
	[FORCE] [RESTRICT] [OPEN {open_pdb_options}]
	Where open_pdb_options has the following syntax:
	READ WRITE READ ONLY
	Where upgrade_options has the following syntax:
	[PFILE=filename] {UPGRADE DOWNGRADE} [QUIET]

Table A-1 (Cont.) Basic SQL*Plus Commands

Database Operation	SQL*Plus Command
Connect to a database	CONNECT [{username[/password] [@connect_identifier] /
	Note : The square brackets shown in boldface type are part of the syntax and do not imply optionality.
List column definitions for a table, view, or synonym, or specifications for a function or procedure	DESCRIBE [schema.] object
Edit contents of the SQL buffer or a file	EDIT [filename [.ext]]
Get a file and load its contents into the SQL buffer	GET filename [.ext] [LIST NOLLIST]
Save contents of the SQL buffer to a file	SAVE filename [.ext] [CREATE REPLACE APPEND]
List contents of the SQL buffer	LIST [n n m n LAST]
Delete contents of the SQL buffer	DEL [n n m n LAST]
Add new lines following current line in the SQL buffer	INPUT [text]
Append text to end of current line in the SQL buffer	APPEND text
Find and replace first occurrence of a text string in current line of the SQL buffer	CHANGE sepchar old [sepchar [new [sepchar]]]
	sepchar can be any nonalphanumeric ASCII character such as "/" or "!"
Capture query results in a file and, optionally, send contents of file to default printer	SPOOL [filename[.ext]
Run SQL*Plus statements stored in a file	<pre>@ { url filename [.ext] } [arg]START { url filename [.ext] } [arg]</pre>
	ext can be omitted if the filename extension is .sql

Table A-1 (Cont.) Basic SQL*Plus Commands

Database Operation	SQL*Plus Command
Execute commands stored in the SQL buffer	/
List and execute commands stored in the SQL buffer	RUN
Execute a single PL/SQL statement or run a stored procedure	EXECUTE statement
Disconnect from a database	DISCONNECT
Shut down a database	SHUTDOWN [ABORT IMMEDIATE NORMAL TRANSACTIONAL [LOCAL]]
Log out of SQL*Plus	{ EXIT QUIT } [SUCCESS FAILURE WARNING n variable :BindVariable] [COMMIT ROLLBACK]
